

Appendix 7 – Robustness Check: Wald Test

Wald Test

Cluster	Chi-squared (X ²)	df	P Value	Signif.
Social Class and Material Drivers	20.2	6	0.0026	**
Post-Materialist Drivers	11.1	2	0.0039	**
Social Capital	19.1	3	2.70e-04	***
Political Efficacy	4.9	2	0.0880	+

Note: + $p < 0.1$, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

This robustness test serves as an additional test for Hypothesis 1 to determine which clusters of variables are preponderant for dual engagement. It complements the single coefficient test performed in Table 2. The results of Wald's Test confirm Hypothesis 1, showing that partisan-related variables, particularly those in the social capital cluster, contribute most significantly to the final model. Notably, while the “Social Class and Material Drivers” cluster exhibit a high Chi-square value and a low p-value, it has a much larger number of variables than the other clusters. Moreover, this result is largely driven by the “student” variable, without which much of the significance diminishes, as also indicated by the coefficient test in Table 2.
